Do you ever get the feeling your 24-hour cash machine only works an 8-hour day?

If you do, chances are it isn't called Barney.

CBT

BANK OF NEW ENGLAND
Yale Co-op, 77 Broadway

Her brother had Duchenne Muscular Dystrophy. Which means that though she herself is unaffected by the disease, she could be carrying it in her genes.

And if she is, there's a one-in-four chance her child will inherit Duchenne.

One of the most common and devastating forms of muscular dystrophy, Duchenne is usually passed from mother to child by a defective gene. The task of MDA researchers is to find that gene. And right now they're so close that MDA is pouring all possible resources into the quest.

Once the gene for Duchenne is identified, carriers can be identified, too —with 100% certainty. And the first major step toward finding a cure will have been taken.
